The Politics of Modelling

Numbers Between Science and Policy

Andrea Saltelli and Monica Di Fiore

“*The Politics of Modelling: Numbers between Science and Policy* is a breath of fresh air and a much-needed cautionary view of the ever-increasing dependence on mathematical modelling in ever-widening directions. The five aspects of modelling that should be 'minded' are a sensitive summary of factors that should be considered when evaluating any mathematical model.”

ORRIN H. PILKEY, PROFESSOR, DUKE UNIVERSITY'S NICHOLAS SCHOOL OF THE ENVIRONMENT, CO-AUTHOR, WITH LINDA PILKEY-JARVIS, OF *USELESS ARITHMETIC: WHY ENVIRONMENTAL SCIENTISTS CAN'T PREDICT THE FUTURE*, COLUMBIA UNIVERSITY PRESS, WASHINGTON, DC, 2009

View on mstdn.social

But the real strength of the models, in my mind at least, were in sensitivity analysis (where one could examine the response of the model to parameters or structures that were not known with precision (i.e., sensitivity analysis), and in the examination of the behavior of the model components relative to that of the real system in question (i.e., validation).

Hall, C. A. S. (2020). Systems Ecology and Limits to Growth: History, Models, and Present Status. In G. S. Metcalf, K. Kijima, & H. Deguchi, eds., *Handbook of Systems Sciences*, Singapore: Springer, , pp. 1–38.

… By undertaking sensitivity analysis and validation, a great deal can be learned about the real system, including what you do not know. (Hall, 2020)

Hall, C. A. S. (2020). Systems Ecology and Limits to Growth: History, Models, and Present Status. In G. S. Metcalf, K. Kijima, & H. Deguchi, eds., *Handbook of Systems Sciences*, Singapore: Springer, , pp. 1–38.

Linear programming and sensitivity analysis

Linear programming viewpoint: testing which parameter, when changed in isolation, lead to a change in the optimal solution

Global SA viewpoints: explore the distribution of the optimal solution when all uncertain coefficients are allowed to vary over their plausible range

We should not be surprised that the sensitivity analysis practiced in linear programming is linear!

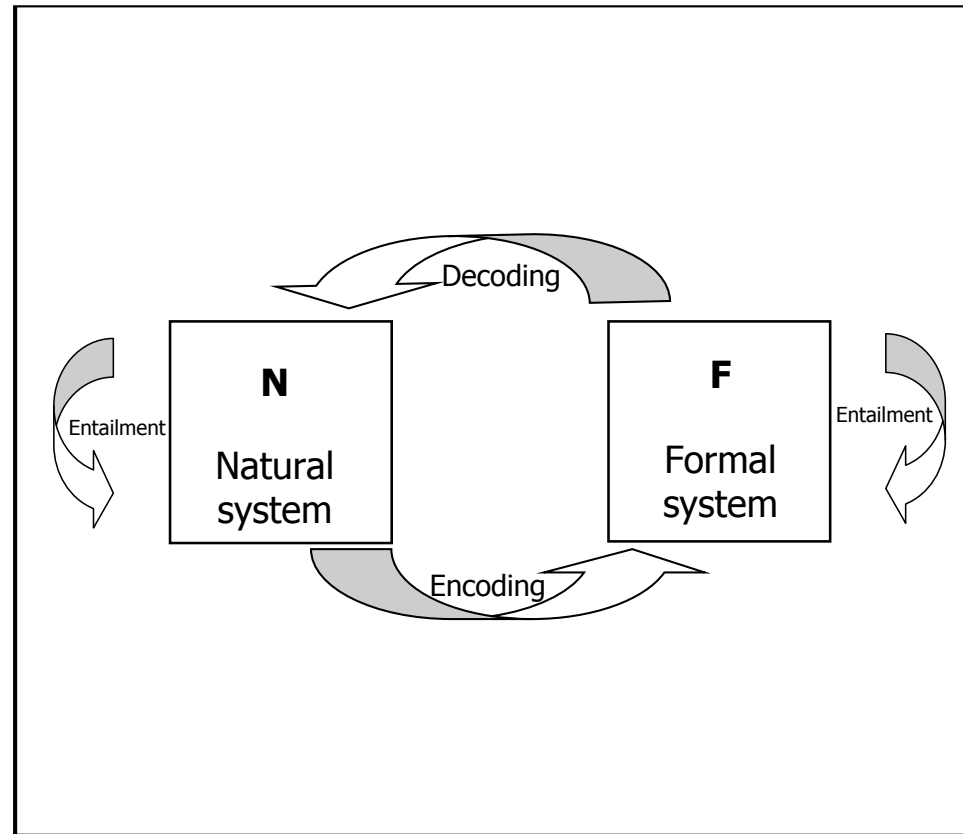

Yet so much can be lost by neglecting that part of the uncertainty that escapes linearity

The advantages of understating global methods for uncertainty and sensitivity analysis are very large, including the possibility to test to flexibility of managerial decision when ‘all the rest’ is varying as well

Modelling is a craft more than a science

Modelling as a craft rather than as a science for Robert Rosen

R. Rosen, *Life Itself: A Comprehensive Inquiry Into the Nature, Origin, and Fabrication of Life*. Columbia University Press, 1991.

Louie, A.H. 2010. "Robert Rosen's Anticipatory Systems." Edited by Riel Miller. *Foresight* 12 (3): 18–29. <https://doi.org/10.1108/14636681011049848>.

What is a model ?

Robert Rosen
(1934-1998)

“models are most useful when they are used to challenge existing formulations, rather than to validate or verify them”

Naomi Oreskes

N. Oreskes, K. Shrader-Frechette, and K. Belitz, “Verification, Validation, and Confirmation of Numerical Models in the Earth Sciences,” *Science*, 263, no. 5147, 1994.

Models are not physical laws

Oreskes, N., 2000, Why predict? Historical perspectives on prediction in Earth Science, in Prediction, Science, Decision Making and the future of Nature, Sarewitz et al., Eds., Island Press, Washington DC

“[...] to be of value in theory testing, the predictions involved must be capable of refuting the theory that generated them”
(N. Oreskes)

“When a model generates a prediction, of what precisely is the prediction a test? The laws? The input data? The conceptualization?”

Any part (or several parts) of the model might be in error, and there is no simple way to determine which one it is”

Models have little memory

“[...] The process of constructing and validating [value-at risk] models is time consuming and detail oriented; normally even the people who produced the model will not remember many of the assumptions incorporated into it, short of redoing their work, which means that the client cannot simply ask them what went into it.”

E. Millgram *The Great Endarkenment*, p. 29

Caeteris are never paribus

Ceteris paribus or caeteris paribus (Latin) = "all other things being equal" or "other things held constant" or "all else unchanged"

Don't confuse the map with the territory

If you do, sensitivity analysis will not save you

<<It is important, however, to recognize that the sensitivity of the parameter in the equation is what is being determined, not the sensitivity of the parameter in nature>>

Orrin H. Pilkey

Useless Arithmetic: Why Environmental Scientists Can't Predict the Future
by Orrin H. Pilkey and Linda Pilkey-Jarvis, Columbia University Press, 2009.

<<...If the model is wrong or if it is a poor representation of reality, determining the sensitivity of an individual parameter in the model is a meaningless pursuit>>

One of the examples discussed concerns the **Yucca Mountain** repository for radioactive waste. TSPA model (for total system performance assessment) for safety analysis.

TSPA is Composed of 286 sub-models.

TSPA (like any other model) **relies on assumptions** → one is the low permeability of the geological formation → long time for the water to percolate from surface to disposal

The confidence of the stakeholders in TSPA was not helped when evidence was produced which could lead to an upward revision of 4 orders of magnitude of this parameter (the ^{36}Cl story)

In the case of TSPA (Yucca mountain) a range of 0.02 to 1 millimetre per year was used for percolation of flux rate.

→... SA useless if it is instead ~ 3,000 millimetres per year.

“Scientific mathematical modelling should involve constant efforts to falsify the model”

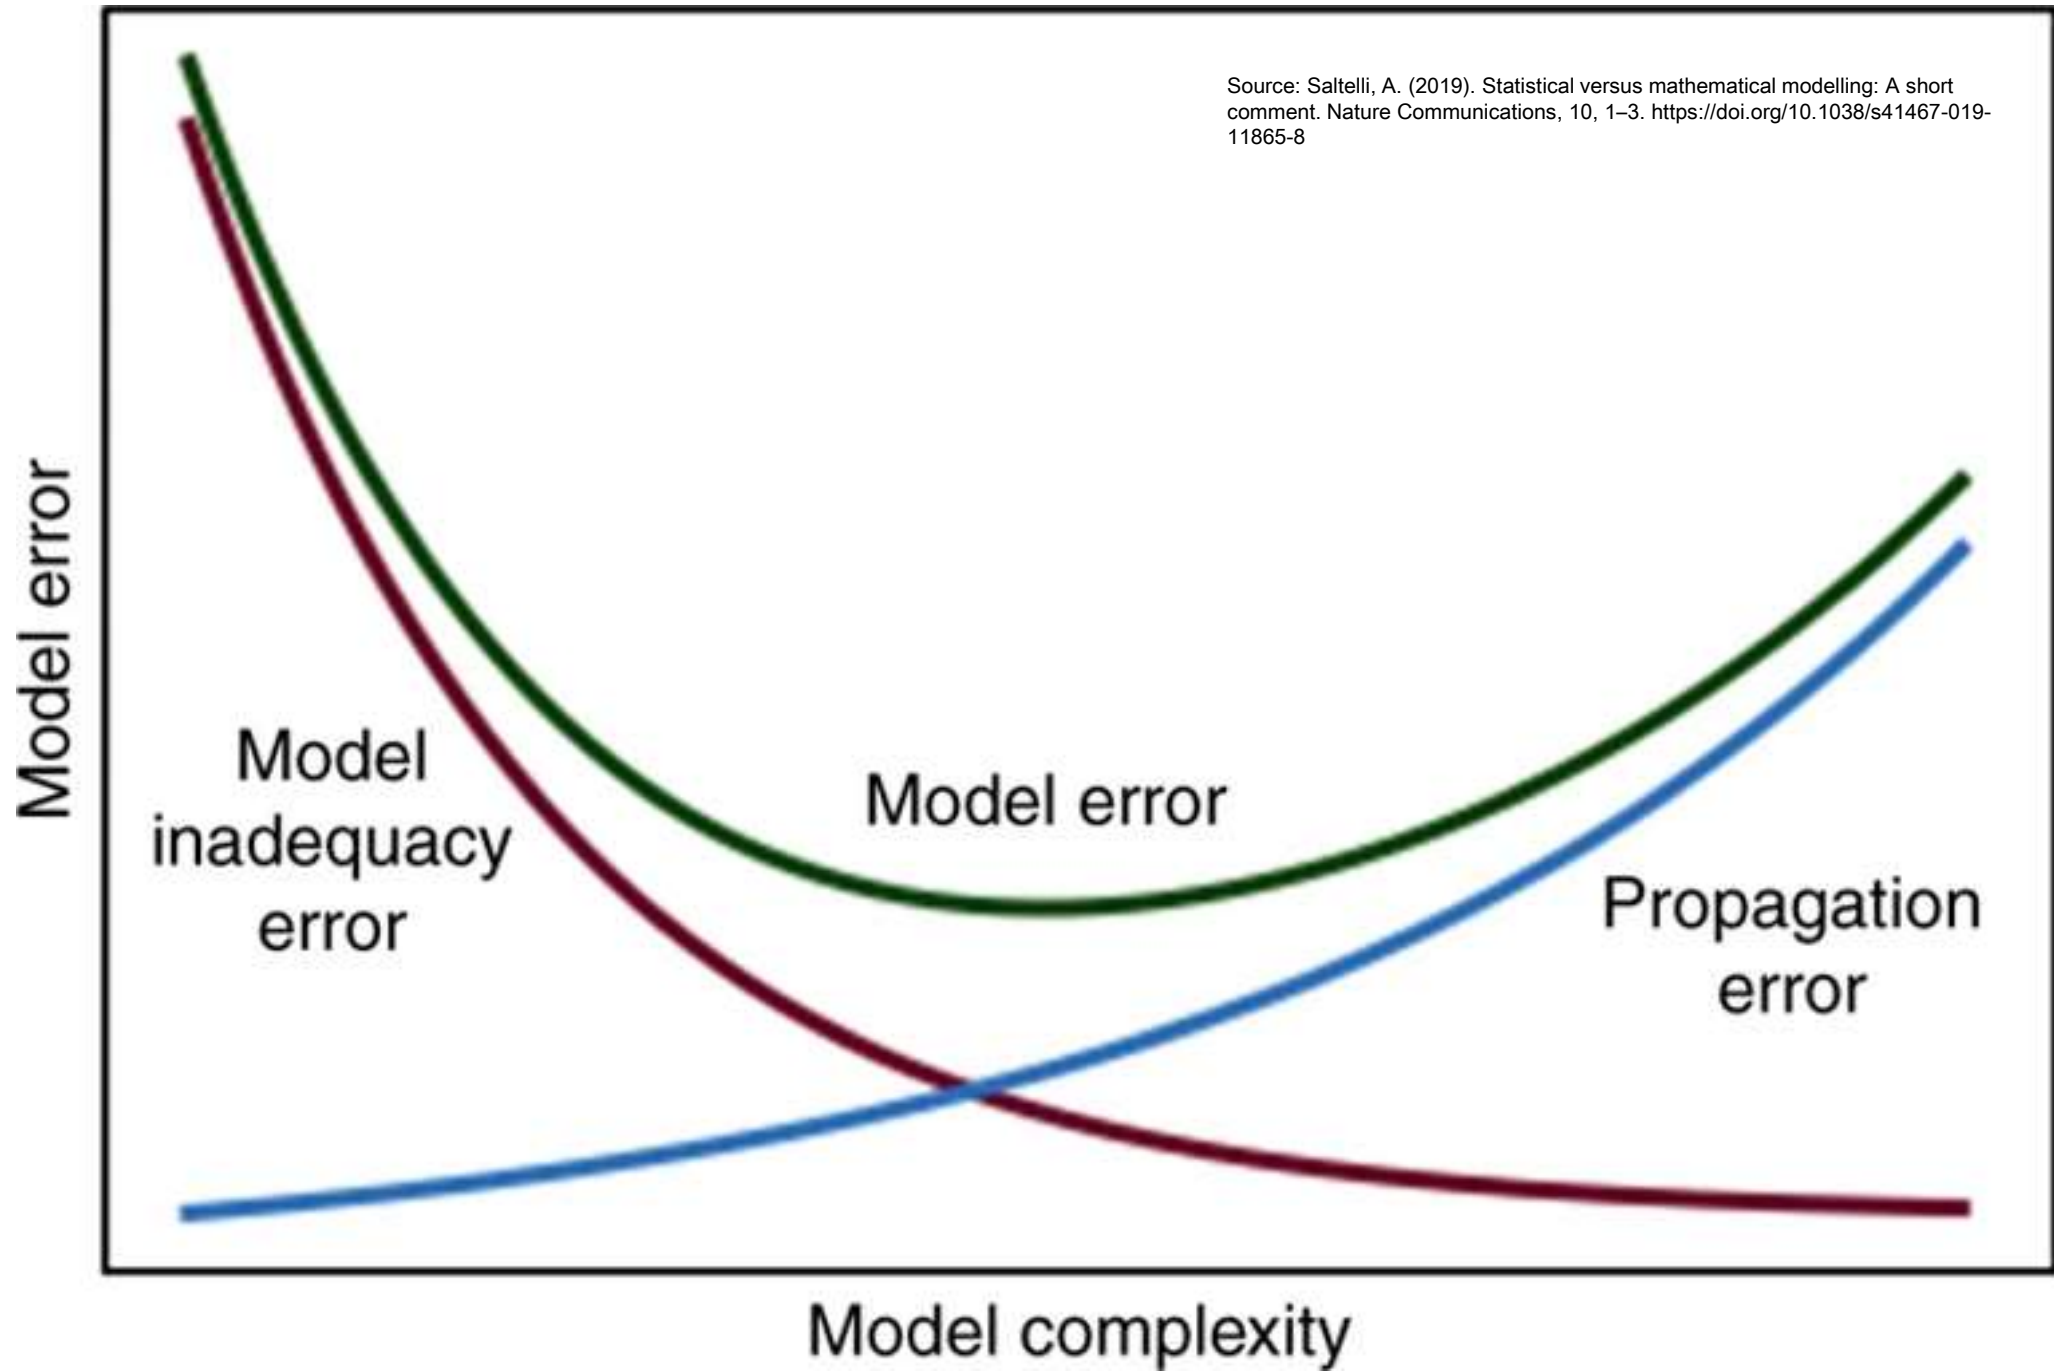

→ Organized skepticism (as per CUDOS)

Communalism, Universalism, Disinterestedness, Organized Skepticism, from sociology of science, Robert K. Merton.

Beware the size of your model

Mind the conjecture of O'Neil

Recipe for Disaster: The Formula That Killed Wall Street

By Felix Salmon 02.23.09

$$\Pr[T_A < 1, T_B < 1] = \Phi_2(\Phi^{-1}(F_A(1)), \Phi^{-1}(F_B(1)), \gamma)$$

Here's what killed your 401(k) *David X. Li's Gaussian copula function as first published in 2000. Investors exploited it as a quick—and fatally flawed—way to assess risk. A shorter version appears on this month's cover of Wired.*

Here is what killed your 401(k)...

Li's Gaussian copula function ...

Nassim Nicholas Taleb, hedge fund manager and author of *The Black Swan*, is particularly harsh when it comes to the copula. "People got very excited about the Gaussian copula because of its mathematical elegance, but the thing never worked," he says. "Co-association between securities is not measurable using correlation," because past history can never prepare you for that one day when everything goes south. "Anything that relies on correlation is charlatanism."

Sensitivity analysis: the study of the relative importance of different input factors on the model output

Sensitivity analysis can:

- surprise the analyst,
- uncover technical errors in the model,
- identify critical regions in the space of the inputs,

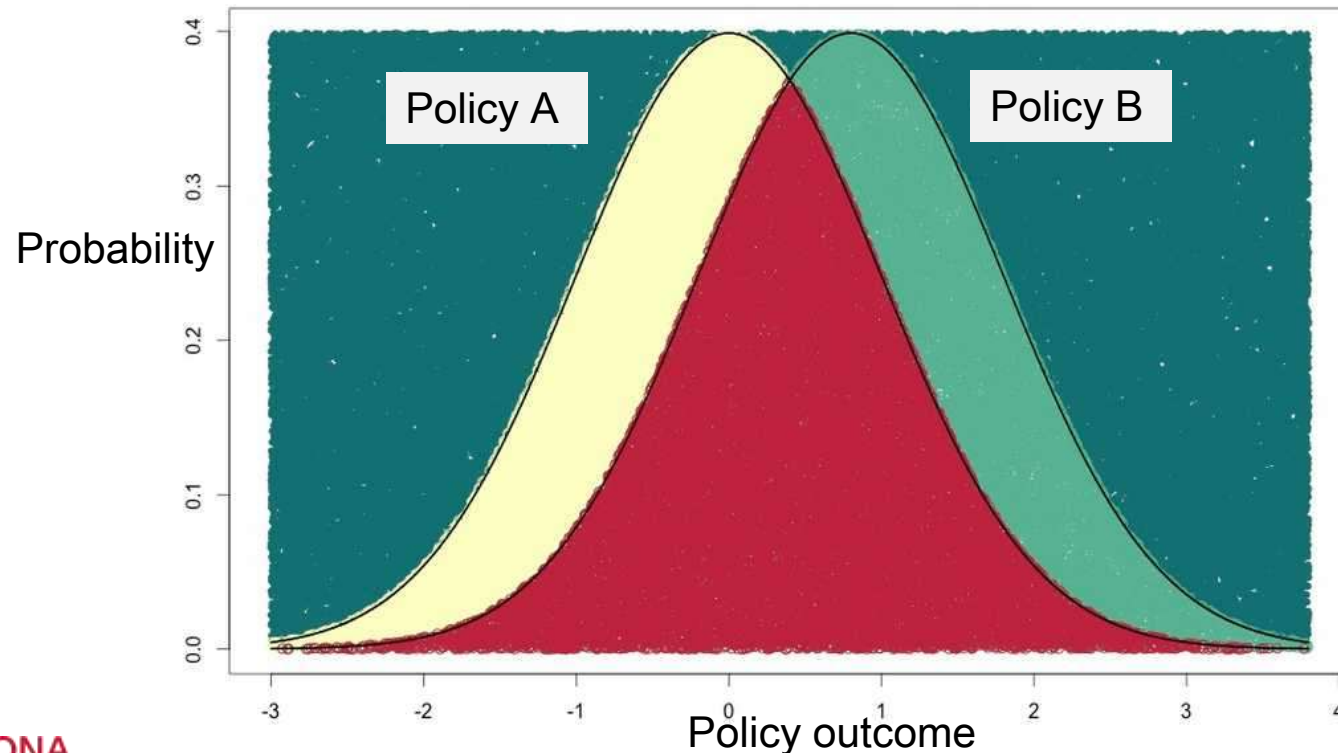

Source: The Simpson, 20th Television Animation
(The Walt Disney Company)

Sensitivity analysis can :

- surprise the analyst,
- uncover technical errors in the model,
- identify critical regions in the space of the inputs,
- establish priorities for research,
- simplify models
- falsify models (show that a model is false or irrelevant)
- defend against your own model being falsified

Sensitivity analysis can:

verify whether policy options (or marketing strategies) can be distinguished from one another given the uncertainties in the system, ...

What method would one choose to perform sensitivity analysis?

Source: iStock by Getty
images

What method would one choose to perform sensitivity analysis?

Most of the sensitivity analysis found in the literature are local or otherwise OAT (One factor At a Time)

$$y = f(x_1, x_2, \dots, x_k)$$

$$\left. \frac{\partial y}{\partial x_i} \right|_{x_i = x_i^0} \longleftarrow \text{Local}$$

What method would one choose to perform sensitivity analysis?

Most of the sensitivity analysis found in the literature are local or otherwise OAT (One factor At a Time)

$$y = f(x_1, x_2, \dots, x_k)$$

$$\frac{x_i^0}{y^0} \frac{\partial y}{\partial x_i} \bigg|_{x_i=x_i^0} \longleftarrow \text{Local}$$

What method would one choose to perform sensitivity analysis?

Most of the sensitivity analysis found in the literature are local or otherwise OAT (One factor At a Time)

$$y = f(x_1, x_2, \dots, x_k)$$

$$\frac{\text{std}(x_i)}{\text{std}(y)} \left. \frac{\partial y}{\partial x_i} \right|_{x_i=x_i^0} \longleftarrow \text{Hybrid}$$

$$\left. \frac{\partial y}{\partial x_i} \right|_{x_i=x_i^0}$$

Relative effect on y of perturbing x_i around its nominal value

$$\left. \frac{x_i^0}{y^0} \frac{\partial y}{\partial x_i} \right|_{x_i=x_i^0}$$

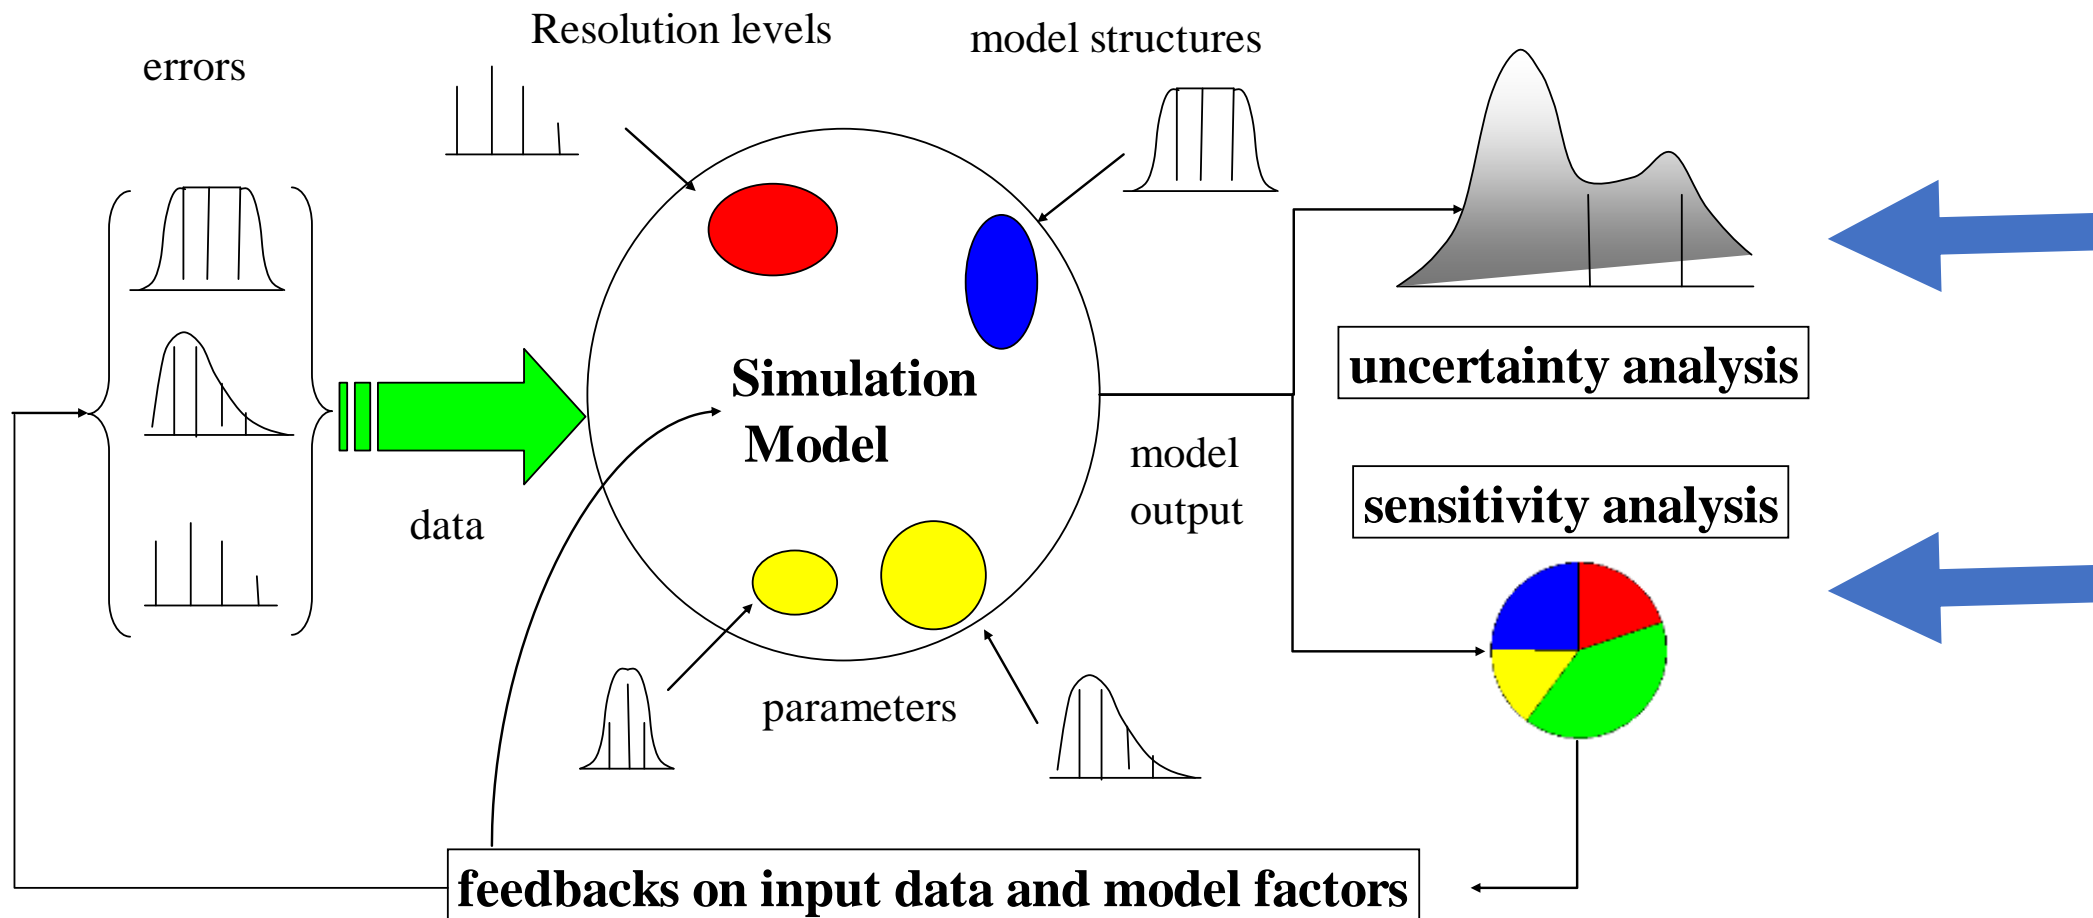

Relative effect on y of perturbing x_i by a fixed fraction of its nominal value

$$\left. \frac{std(x_i)}{std(y)} \frac{\partial y}{\partial x_i} \right|_{x_i=x_i^0}$$

Relative effect on y of perturbing x_i by a fixed fraction of its standard deviation

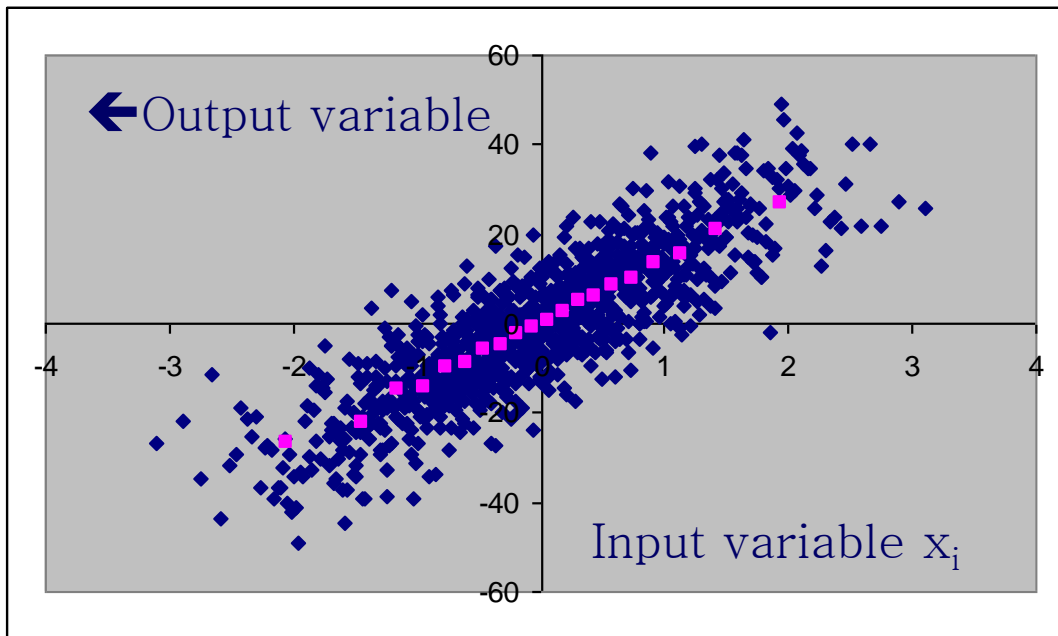

An introduction to variance based methods

Plotting the output as a function of two different input factors

Which factor is more important?

~1,000 blue points

Divide them in 20 bins of ~ 50 points

Compute the bin's average (pink dots)

Each pink point is $\sim E_{\mathbf{X}_{\sim i}}(Y|X_i)$

Taking the variance
of the pink points one
obtains a sensitivity
measure

$$V_{X_i} \left(E_{\mathbf{X}_{\sim i}} (Y | X_i) \right)$$

Which factor
has the highest
 $V_{X_i} (E_{\mathbf{X}_{\sim i}} (Y | X_i))$?

$$S_i = \frac{V_{X_i} \left(E_{\mathbf{X}_{\sim i}} (Y | X_i) \right)}{V(Y)}$$

The partial variance divided by the total variance is the so-called sensitivity index of the first order

Plenty of code available in R, MATLAB, and Python

<https://cran.r-project.org/web/packages/sensitivity/sensitivity.pdf>

<https://cran.rstudio.com/web/packages/sensobol/index.html>

<https://www.uqlab.com/> (in MatLab, by Bruno Sudret and his team)

SALib <https://salib.readthedocs.io/en/latest/>

...but there is more, in R, Python, Julia ...

Advantages with variance based methods:

- graphic interpretation scatterplots
- statistical interpretation (ANOVA)
- expressed plain English
- working with sets
- relation to settings such as factor fixing and factor prioritization
- give the effective dimension

Chapter 1 and its
exercises

... but there are other methods that can be used for different settings, e.g. moment independent methods, Shapley coefficients, reduced spaces, VARS ...

$$\delta_i := \frac{1}{2} \mathbb{E}_{X_i} [s_i (X_i)]$$

where

$$s_i (x_i) := \int_{\Omega_Y} |f_Y (y) - f_{Y|X_i=x_i} (y)| dy$$

Monte Carlo Enhancement via Simulation Decomposition: A “Must-Have” Inclusion for Many Disciplines

Mariia Kozlova, Julian Scott Yeomans

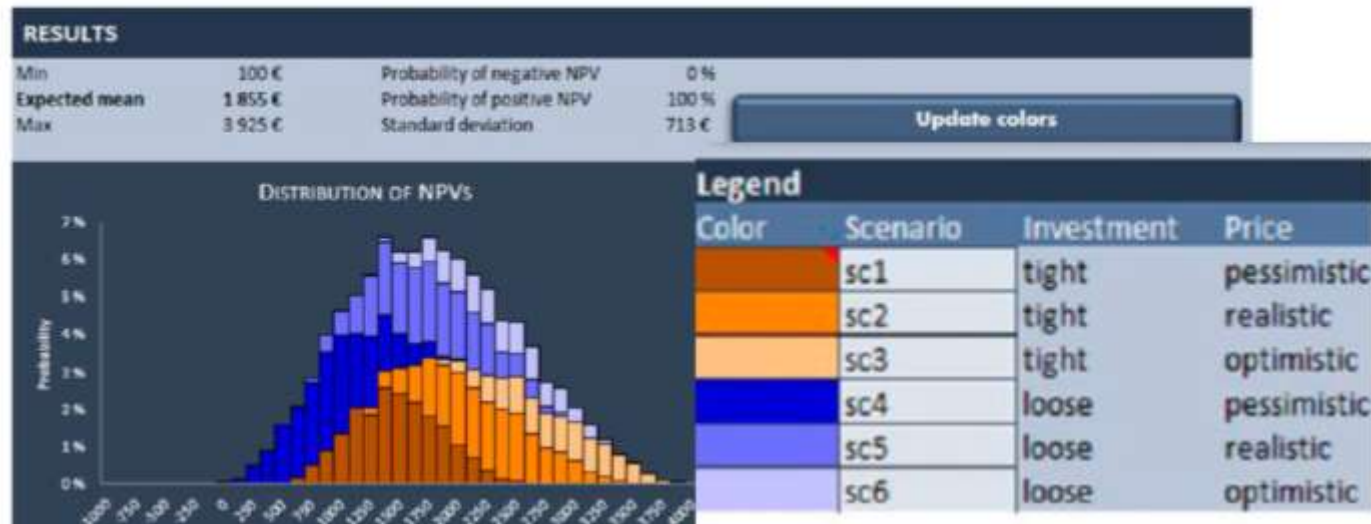

Colouring the output histogram can give sensitivity insights ...

... without computing sensitivity indices

... without computing sensitivity indices

→ The possibility of very low returns (dark blue) corresponds to loose investment and pessimistic prices

What is done here? We have two variables / options:

- Investment= 'tight' or 'loose'
- Price='pessimistic', 'realistic' or 'optimistic'

Combing the 2 levels of investment with the three levels of price gives $2*3=6$ 'scenarios'

Don't run the model just once

There is much to learn by running the model a few times, especially during model building

Lubarsky's Law of Cybernetic Entomology:
there is always one more bug!

Model routinely used to produce point estimates may become non conservative when the uncertainty is plugged in

Current Models Underestimate Future Irrigated Areas

- How much land will need to be irrigated by the year 2050?
- Here the dashed lines represent deterministic model predictions from different models and datasets (from FAO & others organizations);
- An uncertainty analysis (grey histogram) reveals that the models are non-conservative: the need might be much larger

Citation:

Puy, A., Lo Piano, S., & Saltelli, A. (2020). Current models underestimate future irrigated areas. *Geophysical Research Letters*, 47, e2020GL087360. <https://doi.org/10.1029/2020GL087360>

Don't sample just parameters and
boundary conditions

Explore thoroughly the space of the
assumptions

One can sample more than just factors:

- modelling assumptions,
- alternative data sets,
- resolution levels,
- scenarios ...

Assumption

Alternatives

Number of indicators

- all six indicators included or one-at-time excluded (6 options)

Weighting method

- original set of weights,
- factor analysis,
- equal weighting,
- data envelopment analysis

Aggregation rule

- additive,
 - multiplicative,
 - Borda multi-criterion
-

Space of alternatives

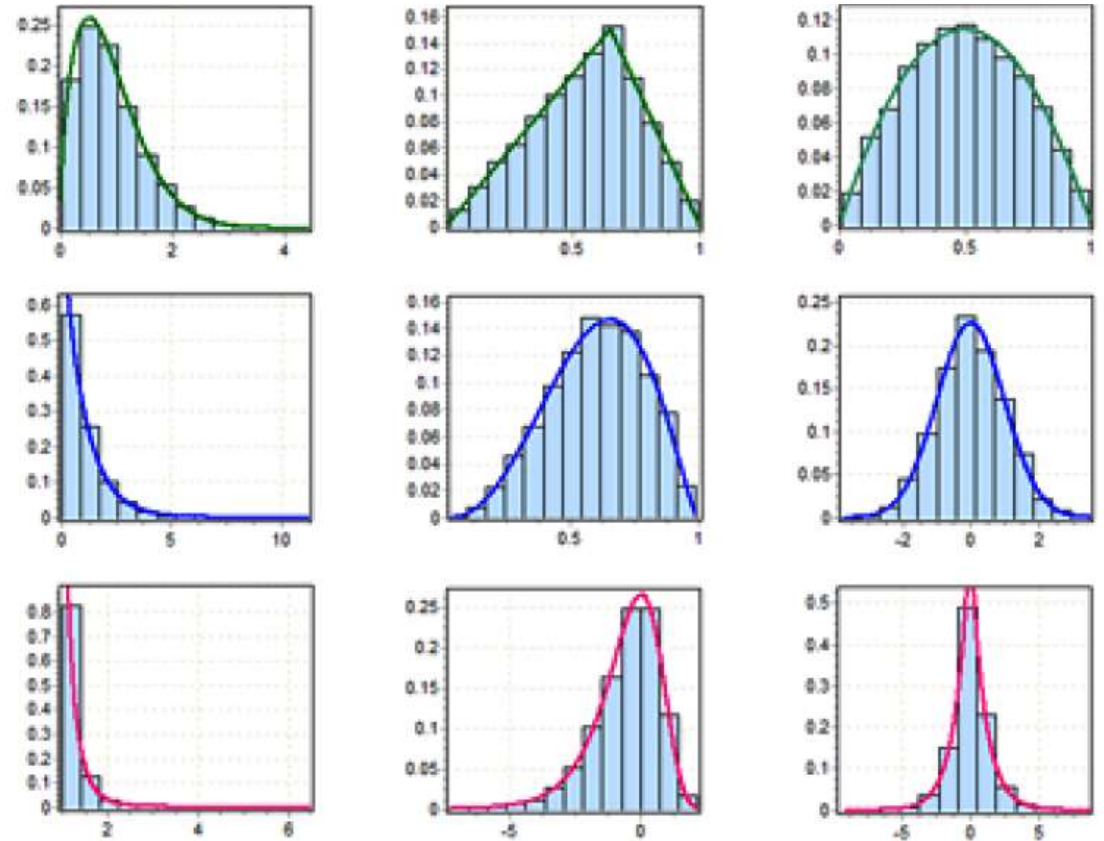

Building a Monte Carlo analysis

$$\begin{array}{ccc} x_{11} & x_{12}\dots & x_{1k} \\ x_{21} & x_{22}\dots & x_{2k} \\ \dots & \dots & \dots \\ x_{N1} & x_{N2} & x_{Nk1} \end{array}$$

Input matrix: each column is a sample of size N from the distribution of a factor

Each row is a sample trial of size k to generate a value of y

Examples of distributions of input factors

NEVER vary all factors of the same amount

Be it 5%, 10%, or 20%

New WHO estimates: Up to 190 000 people could die of COVID-19 in Africa if not controlled

07 May 2020

Brazzaville – Eighty-three thousand to 190 000 people in Africa could die of COVID-19 and 29 million to 44 million could get infected in the first year of the pandemic if containment measures fail, a new study by the World Health Organization (WHO) Regional Office for Africa finds. The research, which is based on prediction modelling, looks at 47 countries in the

Speculative scenario in which ten uncertain input probabilities are increased by an arbitrary 10% — as if they were truly equally uncertain — with no theoretical or empirical basis for such a choice

In a numerical experiment relating to a real-life application the range of uncertainty of each input is crucial input to the analysis, and often the most expensive to get

Why so many published sensitivity analyses are false: A systematic review of sensitivity analysis practices

Andrea Saltelli ^{a, b} ✉, Ksenia Aleksankina ^c, William Becker ^d, Pamela Fennell ^e, Federico Ferretti ^d, Niels Holst ^f, Sushan Li ^g, Qiongli Wu ^h

Abstract Lucca Thursday Dec 14 2023

Why sensitivity Analysis?

Ecologist Charles Hall argued that "the real strength of the models is in their sensitivity analysis (where one could examine the response of the model to parameters or structures that were not known with precision, and in the examination of the behavior of the model components relative to that of the real system in question (i.e., validation). By undertaking sensitivity analysis and validation, a great deal can be learned about the real system, including what you do not know." (Hall, 2020)

We revisit Hall's conjecture with some example, looking at how sensitivity analysis has established itself as a discipline with many practitioners in several disciplines. We look at dos and don'ts, at some best practices, and at some simple ones. We conclude with some mention of what to do where a 'technical' sensitivity analysis is not enough.

The End
