WJP Rule of Law Index 2019

Eight factors further disaggregated into 44 sub-factors

Constraints on Government Powers

- 1.1 Government powers are effectively limited by the legislature
- 1.2 Government powers are effectively limited by the judiciary
- 1.3 Government powers are effectively limited by independent auditing and review
- 1.4 Government officials are sanctioned for misconduct
- 1.5 Government powers are subject to non-governmental checks
- 1.6 Transition of power is subject to the law

One of the eight factors with its 6 sub factors ...

Making the case for gerrymandering?

BATTLEGROUND STATE

North Carolina has been a redistricting battleground for both parties for decades. The US Supreme Court last month ruled that its 1st and 12th districts, drawn up in 2011, were products of racial gerrymandering.

Nature June 2017 article on the mathematics of ‘nailing’ gerrymandering

BATTLEGROUND STATE

North Carolina has been a redistricting battleground for both parties for decades. The US Supreme Court last month ruled that its 1st and 12th districts, drawn up in 2011, were products of racial gerrymandering.

“[US] ranked 55th of 158 nations — last among Western democracies — in a 2017 index of voting fairness (Electoral Integrity Project)”

Carrie Arnold, 2017, The mathematicians who want to save democracy, 200, NATURE, VOL 546, 8 JUNE 2017.

Quality of composite indicators

Specific elements of quality for composite indicators

RELEVANCE

In the context of composite indicators, relevance has to be evaluated considering the degree to which it meet current and potential needs of the users

[...] ensure that the right range of domains is covered in a balanced way

ACCURACY

The credibility of data products refers to confidence that users place in ... the image of the data producer, i.e., the brand image ...

[crucial] that the data are perceived to be produced professionally and that practices are transparent

(for example, data are not manipulated, nor their release timed in response to political pressure)

COHERENCE

... ensure coherence over time and across countries ...
Coherence across countries implies that from country to country the data are based on common concepts, definitions, classifications and methodology, or that any differences can be justified

History

The first scoreboard?

Ian Hacking, 1990, The taming of chance,
Cambridge University Press.

Statistics \leftrightarrow nation state \leftrightarrow Modernity

Leibnitz, ‘philosophical
godfather of Prussian official
statistics’.

Gottfried Wilhelm
Leibniz (1646–1716)

His proposal to the Prince
Frederik of Prussia, 1700

56 categories to ‘measure the power of a state’, the first scoreboard;

- number of marriageable girls,
- able bodied capable to carry arms,
- diseases,
- child mortality,
- ...
- number of Jews

Gottfried Wilhelm
Leibniz (1646–1716)

Is a theory for composite
indicators possible?

Elements for a comprehensive assessment of public indicators

Paul-Marie Boulanger

2014

Editor: Andrea Saltelli

Paul-Marie Boulanger

Paul-Marie Boulanger, 2014, Elements for a comprehensive
assessment of public indicators, Report EUR 26921 EN.
<http://publications.jrc.ec.europa.eu/repository/bitstream/JRC92162/lbna26921enn.pdf>

CI as boundary objects, between analysis and advocacy, as:

- instruments of democratization of expertise;
- instruments of social discovery
- semiotic objects

Paul-Marie Boulanger, 2014, Elements for a comprehensive assessment of public indicators, Report EUR 26921 EN.

<http://publications.jrc.ec.europa.eu/repository/bitstream/JRC92162/lbna26921enn.pdf>

A triadic conception of the sign as structure connecting three elements:

- the sign properly said (S);
- an object (O) and
- an “interpretant”(I)

Charles Sanders Peirce,
the father of semiotics
1839–1914

“This monkey possess a sophisticated repertory of vocal signs for signaling the presence of a predator”

African vervet monkey
(*Cercopithecus aethiops*)

It can distinguish

- a terrestrial stalking one such as a leopard,
- an aerial raptor such as an eagle or
- a ground predator such as a snake

African vervet monkey
(*Cercopithecus aethiops*)

Sign \leftrightarrow Cry

Object \leftrightarrow Predator

Interpretant \leftrightarrow Behaviour

Composite indicators as
instrumental to the creation of a
new public, through a process
of social discovery (J. Dewey)

John Dewey
1859–1952

Dewey, J., 1938. *The Public and its Problems*, Read
Book Ltd. Edition, 2013.

Why are ‘social discoveries’ needed?

Because there are ‘publics’ affected by transaction taking place somewhere else.

“[...] machine age has so enormously expanded, multiplied, intensified and complicated the scope of the indirect consequences [...] that the resultant public cannot identify and distinguish itself”

Dewey, J., 1938. *The Public and its Problems*, Read Book Ltd. Edition, 2013.

Social facts – unlike physical facts,
are only meaningful in a context of
desired ends

From J. Dewey 'Social Science and Social Control' in John
Dewey: The Later Works, 1925–1953: 1931–
1932, Vol. 6–ExLibrary,

Building a composite indicator can be seen as a process of social discovery for which a model of extended participation comes natural.

Frames and indicators are co-produced in the process which must be designed as to have a meaningful ‘interpretant’, or ‘end-in-sight’

Critique of composite indicators: the Fitoussi–Stiglitz–Sen report

“The role [of statistical indicators] has increased significantly over the last two decades.

Jean-Paul Fitoussi,
Amartya Sen, Joseph Stiglitz

This reflects improvements in the level of **education** in the population, increases in the **complexity** of modern economies and the widespread use of **information technology**”

CMEPSP (2009). Commission on the Measurement of Economic Performance and Social Progress, URL: [http://ec.europa.eu/eurostat/documents/118025/118123/Fitoussi+ Commission+ report](http://ec.europa.eu/eurostat/documents/118025/118123/Fitoussi+Commission+report), last accessed June 2017.

“a general criticism ... frequently addressed at composite indicators, i.e. the arbitrary character of the procedures used to weight their various components [...]

Jean-Paul Fitoussi,
Amartya Sen, Joseph Stiglitz

[...] an aggregation procedure always means putting relative values on the items that are introduced in the index”

CMEPSP (2009). Commission on the Measurement of Economic Performance and Social Progress, URL: [http://ec.europa.eu/eurostat/documents/118025/118123/Fitoussi+ Commission+ report](http://ec.europa.eu/eurostat/documents/118025/118123/Fitoussi+Commission+report), last accessed June 2017.

“The problem is **not that these weighting procedures are hidden**, non-transparent or non-replicable – they are often very explicitly presented by the authors of the indices, and this is one of the strengths of this literature.

Jean-Paul Fitoussi,
Amartya Sen, Joseph Stiglitz

The problem is rather that **their normative implications are seldom made explicit or justified**”

CMEPSP (2009). Commission on the Measurement of Economic Performance and Social Progress, URL: [http://ec.europa.eu/eurostat/documents/118025/118123/Fitoussi+ Commission+ report](http://ec.europa.eu/eurostat/documents/118025/118123/Fitoussi+Commission+report), last accessed June 2017.

Critique of composite indicators: Ravallion

There are types two indices: those built on economic theory / monetary aggregates / shadow prices and all others (=mashup indices)

Martin Ravallion

+ existing measures of e.g. development or poverty (Human Development Index, HDI, the Multidimensional Poverty Index, MPI) are bad at coping with tradeoffs

Martin Ravallion, 2010, Mashup indices of development, Policy Research Working Paper 5432 , The World Bank Development Research Group,
<http://documents.worldbank.org/curated/en/454791468329342000/pdf/WPS5432.pdf>

“
To illustrate the distinction, consider two stylized examples of composite indices, both formed from the data on household assets and consumer durables found in the Demographic and Health Surveys (DHS). For index A the variables and their weights are set by the analyst, who has some concept of “economic welfare” in mind, and thinks this is related to certain variables in the DHS, which are aggregated based on the analyst’s judgments. For index B, the variables and weights are instead based on a regression model calibrated to another survey data set for which a comprehensive measure of consumption (though still containing measurement errors) could be derived. The model is calibrated to common variables in the expenditure survey and the DHS, and the regression model is used to predict wealth in the DHS. A is a mashup index, B is not.”

(M. Ravallion)

Since composite indicators
are here to stay, how can
we make them defensible?

... or how can we
deconstruct them?

Tools for evidence appraisal such
sensitivity analysis and sensitivity auditing
can be useful to gauge (and possibly
deconstruct **or reinforce**) these measures

Sensitivity analysis

Ratings and rankings: voodoo or science?

Paolo Paruolo

University of Insubria, Varese, Italy

and Michaela Saisana and Andrea Saltelli

European Commission, Ispra, Italy

The linear aggregation paradox:
weights are used as if they were
importance coefficients while they
are trade off coefficients

An example. A dean wants to rank teachers based on ‘hours of teaching’ and ‘number of publications’ ...

$$Y = 0.5X_1 + 0.5X_2$$

X_1 : hours of teaching

X_2 : number of publications

... adding these two variables up she sees that teachers are practically ranked by publications alone

Dean's example: $y = x_1 + x_2$.

Estimated $R_{ht}^2 = 0.0759$, $R_{np}^2 = 0.826$

To obviate this the dean substitutes the model

$$y=0.5x_1+0.5x_2$$

with

$$y=0.7x_1+0.3x_2$$

A professor comes by, looks at the last formula, and complains that publishing is disregarded in the department ...

hours of teaching

number of publications

Using a result from sensitivity analysis the
scatterplots → numbers reflecting the
importance of a variable

The straight line corresponds to R^2

The variance of the moving average is a sensitivity measure

Pearson's correlation
ratio

Smoothed curve

$$S_i \equiv \eta_i^2 := \frac{V_{x_i} (\mathbf{E}_{\mathbf{x}_{\sim i}} (y \mid x_i))}{V(y)}$$

First order sensitivity index

Unconditional
variance

S_i is the expected fractional variance reduction that would be achieved on average if x_i could be fixed

Why (an exercise) ?

$$S_i = \frac{V(E(Y|x_i))}{V(Y)}$$

$$V(E(Y|x_i)) + E(V(Y|x_i)) = V(Y)$$

Normalization paradox: weights are assigned as to add up to one. This is questionable.

Given a simple CI $Y = w_1x_1 + w_2x_2$

If both x_1 and x_2 are standardized the

importance of x_1 is $S_1 = \frac{w_1^2}{w_1^2 + w_2^2}$

and $S_1 + S_2 = 1$

Thus the relative importance of x_1, x_2

is not $\frac{w_1}{w_2}$ but $\frac{w_1^2}{w_2^2} \dots$

... and the absolute importance are not $\frac{w_1}{w_1 + w_2}$

and $\frac{w_2}{w_1 + w_2}$

but $\frac{w_1^2}{w_1^2 + w_2^2}$ and $\frac{w_2^2}{w_1^2 + w_2^2}$

Implications?

	x_1	x_2
Presumed importance	10%	90%
Real importance	1.2%	98.8%

$$\frac{w_1}{w_1 + w_2}, \frac{w_2}{w_1 + w_2}$$

$$\frac{w_1^2}{w_1^2 + w_2^2}, \frac{w_2^2}{w_1^2 + w_2^2}$$

This holds if we use our definition of importance (what expected fraction of the variance of Y would be reduced on average if x_1 could be fixed) but you can verify this empirically using scatterplots

$w_1=0.1, w_2=0.9$

$$w_1 = 0.1, w_2 = 0.9$$

$w_1=0.316, w_2=0.949$

$$w_1 = 0.32, w_2 = 0.95$$

@andreasaltelli

We shall review some elements of **history** of composite indicators, reasons for and against their use, and available theories for their construction. We shall then touch on some common methodological **conundrums**, with possible solutions based on the theory of sensitivity analysis. After noting the strong normative dimension of these measures—which ultimately aim to ‘tell a story’, e.g. to promote the social discovery of a particular phenomenon, we inquire whether a less partisan use of a composite indicator can be proposed by allowing more latitude in the framing of its construction. We thus explore whether a composite indicator can be built to tell ‘**more than one story**’ and test this in practical contexts.
