Fig. 1. Model predictions on aquifer vulnerability towards nitrate pollution for a 175 km² area west of Copenhagen [11].

How to act upon such uncertainty?

Bayesian approach: 5 priors. Average and update likelihood of each grid-cell being red with data (but oooops, there is no data and we need decisions now)

IPCC approach: Lock the 5 consultants up in a room and don't release them before they have **consensus**

Nihilist approach: Dump the science and decide on an other basis

Precautionary robustness approach: protect all grid-cells

Academic bureaucrat approach: Weigh by citation index (or H-index) of consultant.

Select the consultant that you **trust** most

Real life approach: Select the consultant that best fits your **policy agenda**

Post normal: explore the relevance of our ignorance: **working deliberately within imperfections**

Dueling Visions For a Hungry World

Sparks began to fly when scientists and activists against genetically modified crops came together to assess agricultural knowledge and the role of biotech in development.

When economist Carl Pray heard about plans for the first international assessment of agricultural research, a gold standard sprang to mind: the Intergovernmental Panel on Climate Change (IPCC). But things didn't turn out the way he expected.

IPCC has been pivotal in proving that climate change is real and linking it to human activities. As an agricultural economist at Rutgers University who has worked in many poor countries, Pray is convinced that agricultural research—and genetic modification in

mentally, socially and economically sustainable development through the generation, access to, and use of agricultural knowledge, science and technology." Critics say this broad mandate made conflict inevitable and started the assessment's analytical rigor.

On several key issues, consensus proved elusive. Industry scientists and some academics—mainly agricultural economists and plant biologists—believe the assessment was "hijacked" by participants who oppose genetically modified (GM) crops and other common

the outcome. They note that the voice and experience of small-scale farmers, particularly women, have finally been brought to the fore by the assessment. "It really deals with issues of power, influence, and benefits," says Marcia Kishi-Etuman of the Pesticide Action Network North America in San Francisco, California. Toby Kiers, who studies sustainable agriculture at Vrije University in Amsterdam, the Netherlands, agrees. "For technology to be most effective, farmers must be at the center, influencing how it is developed, delivered, and

The follies and fallacies of our forecasters

By Samuel Brittan

Published: May 26 2011 23:22 | Last updated: May 26 2011 23:22

Nothing has done more to discredit serious economic analysis than its identification with the guesses about output, employment, prices and so on which politicians feel obliged to make. [...] True scientific predictions are conditional. They assert that certain changes [...] will, granted other conditions are met, [...], lead to a certain state of affairs [...]. But they cannot tell us that the required conditions will be fulfilled.

The rhetorical question Keynes asks is (Keynes, 1940):

"It will be remembered that the seventy translators of the Septuagint were shut up in seventy separate rooms with the Hebrew text and brought out with them, when they emerged, seventy identical translations. Would the same miracle be vouchsafed if seventy multiple correlators were shut up with the same statistical material?"

Keynes, J. M. , 1940, On a Method of Statistical Business-Cycle Research. A Comment, The Economic Journal, Vol. 50, No. 197 (Mar., 1940), 154-156.

Sensitivity analysis, mandated by existing guidelines as a good practice to use in conjunction to mathematical modelling, is as such insufficient to ensure quality in the treatment of uncertainty of science for policy.

In an adversarial context not only the nature of the evidence, but also the degree of certainty and uncertainty associated to the evidence will be the subject of partisan interests

➔ Extended peer review

[...] in a democracy local populations not only will, but also should, use the sciences in ways most suitable to them. The objections that citizens do not have the expertise to judge scientific matters overlooks that important problems often lie across the boundaries of various sciences so that scientists within these sciences don't have the needed expertise either.

Moreover doubtful cases always produce experts from one side, experts for the other side, and experts in between. But the competence of the general public could be vastly improved by an education that exposes expert fallibility instead of acting as if it did not exist. (Paul Feyerabend, *Against Method*)

[...] knowledge regarding flooding was co-produced. This illustrates a way of working with experts, both certified (academic natural and social scientists) and noncertified (local people affected by flooding), [...] We reveal a deep and distributed understanding of flood hydrology across all experts, certified and uncertified, ...

[...] the purpose of our experiment became as much about creating a new public capable of making a political intervention in a situation of impasse, as it was about producing the solution itself. The practice of knowledge generation, the science undertaken, worked with the hybridisation of science and politics rather than trying to extract science from it.

From sensitivity analysis to sensitivity auditing; Seven rules

1. Check against rhetoric use of mathematical modeling [is the model obfuscate?];
2. Adopt an 'assumption hunting' attitude [what possibly normative assumptions underlying the model?];
3. Detect Garbage In Garbage Out [what data is used in order to achieve a desired inference at a desired time?];
4. Find sensitivity [what parameters are most influential?];
5. Ask [what results make sense of, and possibly replicate, the results of the model?];
6. Consider the viewpoint of a relevant stakeholder [what is the viewpoint of a relevant stakeholder?];
7. For the key question answered by the model, exploring holistically the entire space of the assumptions [do perfunctory analyses changing one factor at a time].

RULE ONE: Check against rhetorical use of mathematical modelling

The instrumental use of mathematical modelling to advance one's agenda can be termed rhetorical, or strategic, like the use of Latin by the elites and the clergy in the classic age.

RULE ONE: Check against rhetorical use of mathematical modelling

<<[...] most simulation models will be complex, with many parameters, state-variables and non linear relations. Under the best circumstances, such models have many degrees of freedom and, with **judicious fiddling, can be made to produce virtually any desired behaviour**, often with both plausible structure and parameter values.>>

HORNBERGER and Spear (1981).

George M.
Hornberger,
Professor at
University of
Virginia

Pocket Books 1987, p.69

RULE ONE: Check against rhetorical use of mathematical modelling

“Well, Gordon’s great insight was to design a program which allowed you to specify in advance what decision you wished it to reach, and only then to give it all the facts. The program’s task, [...], was to construct a plausible series of logical-sounding steps to connect the premises with the conclusion.”

‘Perverse incentives and flawed models – accelerated by a race to the bottom’, p. 92

[...] Part of the agenda of computer models was to maximize the fraction of, say, a lousy sub-prime mortgage that could get an AAA rating, then an AA rating, and so forth,[...] This was called rating at the margin, and the solution was still more complexity”, p. 161

RULE ONE: Check against rhetorical use of mathematical modelling

Useless Arithmetic: Why Environmental Scientists Can't Predict the Future by Orrin H. Pilkey and Linda Pilkey-Jarvis

‘Quantitative mathematical models used by policy makers and government administrators to form environmental policies are seriously flawed’

RULE ONE: Check against rhetorical use of mathematical modelling

TSPA (like any other model) relies on assumptions → one is the low permeability of the geological formation → long time for the water to percolate from surface to disposal.

The confidence of the stakeholders in TSPA was not helped when evidence was produced which could lead to an upward revision of **4 orders of magnitude** of this parameter
(the ^{36}Cl story)

RULE ONE: Check against rhetorical use of mathematical modelling

A range of 0.02 to 1 millimetre per year was used for percolation of flux rate.

→... SA useless if it is instead ~ 3,000 millimetres per year.

RULE TWO: Adopt an ‘assumption hunting’ attitude;

What was ‘assumed out’? What are the tacit, pre-analytic, possibly normative assumptions underlying the analysis?

E.g. in ‘Bogus Quantification: Uses and Abuses of Models’ John Kay uncovers that the UK transport WebTAG model (the standard for transport policy simulation) needs as input ‘Annual Percentage Change in Car Occupancy up to 2036.’

John Kay, London School Economics, Columnist Financial Times

A wise man knows one thing – the limits of his knowledge,
John Kay, FT

November 30, 2011.

“[...] The models share a common approach. They pose the question: “How would we make our decision if we had complete knowledge of the world?” With such information you might make a detailed assessment [...]. But little of this knowledge exists. So you make the missing data up. You assume the future will be like the past [...]. The impression of rationality these procedures convey is spurious.”

“[...] If you do not know the answer to a question, the right response is not to make a number up, but to rethink and frame an alternative question that is capable of being answered.”

John Kay's approach is called 'Assumptions hunting' in Dutch circles ...

RULE FOUR : find sensitivities before sensitivities find you;

Stern's Review – Technical Annex to postscript (a **sensitivity analysis** of a **cost benefit analysis**)

The Stern - Nordhaus exchange on *SCIENCE*

Nordhaus → falsifies Stern based on 'wrong' range of discount rate (~ you GIGOing)

Stern → 'My analysis shows robustness'

My problems with it:

... but foremost Stern says:

changing assumptions → important effect

when instead he should admit that:

changing assumptions → all changes a lot

How was it done? A reverse engineering of the analysis

Missing points

% loss in GDP per capita

RULE FOUR : find sensitivities before sensitivities find you;

Same criticism applies to Nordhaus – both authors frame the debate around numbers which are ...

... precisely wrong

RULE FOUR : find sensitivities before sensitivities find you;

Peter Kennedy, A Guide to Econometrics. Anticipating criticism by applying sensitivity analysis. This is one of the ten commandments of applied econometrics according to Peter Kennedy:

<<Thou shall confess in the presence of sensitivity.

Corollary: Thou shall anticipate criticism

>>

RULE FOUR : find sensitivities before sensitivities find you;

<<When reporting a sensitivity analysis, researchers should explain fully their specification search so that the readers can judge for themselves how the results may have been affected. This is basically an 'honesty is the best policy' approach, [...]'.>>

RULE FIVE: aim for transparency

Doubts raised over Europe's green energy plan

Host of questions from advisers

Economic model lacks transparency

By Peter Clark in London

The credibility of a European energy review has been cast into doubt by specialist advisers who say plans to cut carbon emissions up to 50% are based on an economic model owned by a single think tank, a report that cannot be independently verified.

The energy experts have "raised a host of questions" on how the European Commission's use of a non-transparent model could affect the review, according to a leaked report by advisers chosen by Brussels to comment on the "Energy Roadmap 2050" proposals.

The economic model, known as PRIMA, is owned by the National Technical University of Athens and is designed to show how the use of different sources of energy sources affect the wider economy.

The European Commission has used it for years to help guide the bloc's energy policies. But industry critics complain that its assumptions are impossible to question because the model is privately owned. One trade group, Industrija Europe, has called for the Commission to use other, more transparent models.

The forthcoming edition of the energy road map, which will review the extent of closing gas, coal-fired and low nuclear power to meet Europe's green targets, has heightened concerns about the model's transparency, the expert advisers group report shows. One of the group's three meetings was "devoted largely" to how the Commission was using the PRIMA model to produce different energy mix scenarios for the road map.

"There was considerable debate about the role of fuel price assumptions in the PRIMA model," said the report by the group, which is chaired by Einar Røed, an Oxford University economic professor, and

A cooling plant in Germany: the credibility of plan to cut CO₂ emissions has been called into question by experts

includes bodies such as the International Energy Agency.

There were also questions on "the costs of different technologies" and "the assumptions of perfect flexibility by companies but not by individuals".

The group's key concern was "where the transparency of the PRIMA work, and in particular the property rights in the algo-

if the group pointed out that it does have extensive experience in the credibility of the road map."

The advisers group also recommends that the PRIMA model be made publicly available "so that its results can be replicated by interested parties".

Stavros Dimitriadis, a member from the National Technical University of Athens who built the PRIMA model, told the Financial Times he agreed that transparency was important and would not mind if some of the model's workings were made public. "We are not the only ones" - not the software.

A spokeswoman for the energy commissioner, Catherine Stihlberg, said she would see comments on an unpublished document. The first version of the advisers group's report would be released with the energy road map next month.

Prof Capoen has been an energy consultant for many years and has held positions as bodies working from Brussels energy industry in the country's Public Power Corporation.

Independent parties cannot replicate the results because the model is private property

results and detailed internal workings of the model", says the report, which is marked "Top Secret".

"The model remains the private property of the National Technical University of Athens", it says.

"The consequence is that independent parties cannot replicate the model. This is a commercial matter for the Commission, but members

RULE FIVE: aim for transparency

“Experts have “raised a host of questions” about how the European Commission’s use of a non-transparent model could affect the energy review, according to a leaked report by energy specialists chosen by Brussels to advise on the forthcoming “Energy Roadmap to 2050”

FT November 6, 2011

RULE FIVE: aim for transparency

“The credibility of a European energy review has been cast into doubt by experts who point out that long-term plans to cut carbon emissions are based on an economic model owned by a single Greek university that cannot be independently scrutinised.”

RULE SEVEN: Explore diligently the space of the assumptions

“The uncertainties which are more carefully scrutinised are usually those which are the least relevant”
(*lampposting*, Jeroen van der Sluijs).

Nassim Nicholas Taleb calls this ‘The delusion of uncertainty’ .

Uncertainty can be instrumentally amplified or downplayed

RULE SEVEN: Explore diligently the space of the assumptions

How coupled ladders are shaken in most of available literature

How to shake coupled ladders

RULE SEVEN: Explore diligently the space of the assumptions

The most popular SA practice seen in the literature is that of 'one-factor-at-a-time' (OAT). This consists of analyzing the effect of varying one model input factor at a time while keeping all other fixed.

While the shortcomings of OAT are known from the statistical literature, its widespread use among modelers raises concern on the quality of the associated sensitivity analyses

ÉPILOGUE

Examples of troubles to be anticipated :

- ➔ <<You treated X as a constant when we know it is uncertain by at least 30%>>
- ➔ <<Beware: It would be sufficient for a 5% error in X to make your statement about Z fragile>>
- ➔ <<Your model is but one of the plausible models – you neglected model uncertainty>>

- ➔ << You have maximized instrumentally your level of confidence in the results >>
- ➔ << You have artificially inflated uncertainty >>
- ➔ << Your model is a black box – why should I trust your results? >>
- ➔ << Your framing is not socially robust >>
- ➔ << You are answering the wrong question >>
