Better Regulation "Toolbox"

Key documents

Better Regulation Guidelines

These guidelines explain what Better Regulation is and how it should be applied in the day to day practices when preparing new initiatives and proposals or managing existing policies and legislation.

They cover the whole policy cycle, from policy preparation and adoption to implementation and application, to evaluation and revision of EU law. For each of these phases there are a number of Better Regulation principles, objectives, tools and procedures to make sure that the EU has the best regulation possible. These relate to planning, impact assessment, stakeholder consultation, implementation and evaluation.

The [Better Regulation Guidelines](#) are structured into chapters which cover each of the instruments of the law-making process. The corresponding [toolbox](#) gives more detailed and technical information.

Better Regulation Guidelines are based on the outcomes of public consultation exercises carried out in 2013 and 2014.

- [Public consultation on the revision of the Commission's Impact Assessment Guidelines](#)
- [Stakeholder Consultation Guidelines](#)
- [Consultation on the draft Commission Evaluation Policy Guidelines](#)

An engineer's vision of UA, SA

One can sample more than just factors:

- modelling assumptions,
- alternative data sets,
- resolution levels,
- scenarios ...

Assumption	Alternatives
Number of indicators	<ul style="list-style-type: none">▪ all six indicators included or one-at-time excluded (6 options)
Weighting method	<ul style="list-style-type: none">▪ original set of weights,▪ factor analysis,▪ equal weighting,▪ data envelopment analysis
Aggregation rule	<ul style="list-style-type: none">▪ additive,▪ multiplicative,▪ Borda multi-criterion

Space of alternatives

Why sensitivity analysis

"Are the results from a particular model more sensitive to changes in the model and the methods used to estimate its parameters, or to changes in the data?"

... SA can tell

Presented as ‘Conjecture by O’Neill’

In M. G. Turner and R. H. Gardner,
“Introduction to Models” in Landscape
Ecology in Theory and Practice, New
York, NY: Springer New York, 2015, pp.
63–95.

Why sensitivity
analysis

Also known as Zadeh's principle of incompatibility,
whereby as complexity increases “precision and
significance (or relevance) become almost mutually
exclusive characteristics”

L. Zadeh, “Outline of a New Approach to the Analysis of Complex Systems
and Decision Processes,” IEEE Trans. Syst. Man. Cybern., vol. 3, no. 1, pp.
28–44, 1973.

Model-based knowing is
conditional; SA explains this
conditionality

Why sensitivity
analysis

SA can detect garbage in
garbage out (GIGO)

Why sensitivity
analysis

Funtowicz & Ravetz's GIGO (Garbage In, Garbage Out) Science “where uncertainties in inputs must be suppressed least outputs become indeterminate”

Leamer's “Conclusions are judged to be sturdy only if the neighborhood of assumptions is wide enough to be credible and the corresponding interval of inferences is narrow enough to be useful”

S. Funtowicz and J. R. Ravetz, *Uncertainty and Quality in Science for Policy*. Dordrecht: Kluwer, 1990; E. E. Leamer, “Sensitivity Analyses Would Help,” *Am. Econ. Rev.*, vol. 75, no. 3, pp. 308–313, 1985.

Why sensitivity
analysis

Exploring Hoover and Perez's experimental designs using global sensitivity analysis

William Becker, Paolo Paruolo, Andrea Saltelli

(Submitted on 22 Jan 2014)

This paper investigates variable-selection procedures in regression that make use of global sensitivity analysis. The approach is combined with existing algorithms and it is applied to the time series regression designs proposed by Hoover and Perez. A comparison of an algorithm employing global sensitivity analysis and the (optimized) algorithm of Hoover and Perez shows that the former significantly improves the recovery rates of original specifications.

Being revised for Journal of
Time Series Econometrics

Why using
variance-based
sensitivity analysis
methods

Advantages with variance based methods:

- graphic interpretation scatterplots
- statistical interpretation
- expressed plain English
- working with sets
- relation to settings such as factor fixing and factor prioritization

Without forgetting other methods

- Moment independent
- Shapley coefficients (also for correlated inputs)
- ...

Limit of SA: The map is
not the territory

Orrin H.
Pilkey

Useless Arithmetic: Why Environmental Scientists Can't Predict the Future
by Orrin H. Pilkey and Linda Pilkey-Jarvis, Columbia University Press,
2009.

<<It is important to recognize that the sensitivity of the parameter in the equation is what is being determined, not the sensitivity of the parameter in nature.

[...] If the model is wrong or if it is a poor representation of reality, determining the sensitivity of an individual parameter in the model is a meaningless pursuit.>>

One of the examples discussed concerns the **Yucca Mountain** repository for radioactive waste. TSPA model (for total system performance assessment) for safety analysis.

TSPA is Composed of 286 sub-models.

TSPA (like any other model) **relies on assumptions** → one is the low permeability of the geological formation → long time for the water to percolate from surface to disposal.

Evidence was produced leading to an upward revision
of 4 orders of magnitude of this parameter
(the ^{36}Cl story)

In the model a range of 0.02 to 1 millimetre per year was used for percolation of flux rate.

→... SA useless if it is instead ~ 3,000 millimetres per year.

“Scientific mathematical modelling
should involve constant efforts to
falsify the model”
(Pilkey and Pilkey-Jarvis)

Organized Skepticism – all ideas
must be tested and are subject to
rigorous, structured community
scrutiny.

Communalism – the common ownership of scientific knowledge according to which scientists give up intellectual property in exchange for recognition and esteem (Merton actually used the term Communism, but had this notion of communalism in the context of Marxism);

Universalism – the use of terms of universal validity, regardless of race, class,

CUDOS

truth and
not of

Disinterestedness – according to which scientists are expected to be acting in ways that outwardly appear to be selfless;

Organized **S**kepticism – all ideas must be tested and are subject to rigorous, structured community scrutiny.

Robert K.
Merton

Limit of SA: Often no SA (SA
conflated with UA e.g. in economics) or
one-factor-at-a-time SA
seen in the literature

subject areas >100 articles

Taking the top twenty most-cited papers in each subject area:

➔ 324 articles, divided among authors

Cleansing manually irrelevant articles:

➔ 280 articles

Still many papers
apply an OAT SA:
65%

What if the model is truly linear?

Linear	7%
Nonlinear	61%
Unclear	32%

Linear	7%
Nonlinear	61%
Unclear	32%

65% highly cited articles are OAT

Taking all unclear = linear → still
over 20% of papers wrong
(OAT & non-linear model)

Why?

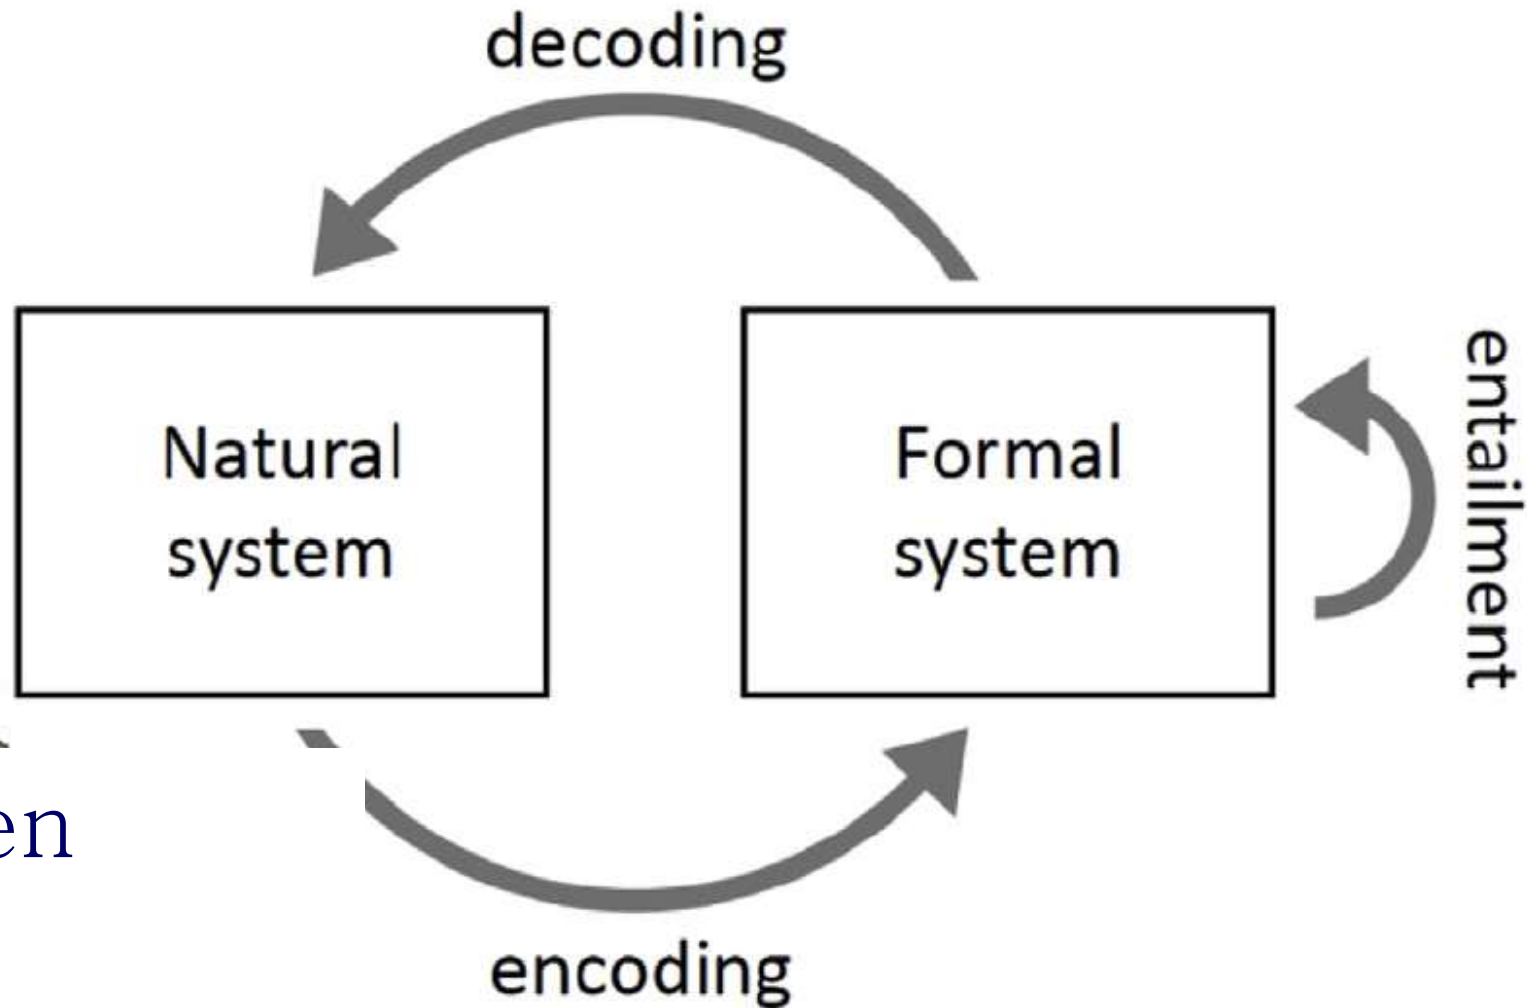

5. Discussion

5.1. Reasons for bad practice

Why? ➔ 1. Modelling as a craft

Robert Rosen

Why? ➔ 2. Each discipline going about modelling on its own separate way; pockets of SA practitioners (out of our 280 papers, 35 were methodological, of which 24 suggest global SA)

Why? ➔ 3. Good practices require
training in statistics

Why? ➡ 4. More time is needed;
researchers tend to emulate methods
found in highly cited papers
(assuming that they are best practice)

Why? 5. Unlike statistics,
modelling is not a discipline ...

... mathematical modelling cannot do this:

**AMERICAN STATISTICAL ASSOCIATION RELEASES STATEMENT ON
STATISTICAL SIGNIFICANCE AND *P*-VALUES**

*Provides Principles to Improve the Conduct and Interpretation of Quantitative
Science*

March 7, 2016

Wasserstein, R.L. and Lazar, N.A., 2016. 'The ASA's statement on p-values: context, process, and purpose', *The American Statistician*, Volume 70, 2016 – Issue 2, Pages 129–133.

Why? ➔ 6. More time is needed; though mature global sensitivity analysis methods around for more than 25 years researchers tend to emulate methods found in highly cited papers assuming that they are best practice

Why? ➔ 7. Strategic reasons: global SA is bad if one wants to play the uncertainty game, inflating or deflating uncertainties instrumentally

Interested? Come to our ‘Numbers for policy’ school in November 18–20, here in Castelldefels
<https://www.uib.no/en/svt/127988/numbers-policy-practical-problems-quantification> with Samuele Lo Piano, Jeroen van der Sluijs and myself.

Solutions? 1. Statistics as a discipline
takes responsibility for statistical
methods for
model validation and verification

Example: who can authoritatively suggest
to modellers not to overinterpret results
from multi-model ensembles?

Climate Models as Economic Guides: Scientific Challenge or Quixotic Quest?

BY ANDREA SALTELLI, PHILIP B. STARK, WILLIAM BECKER, PAWEL STANO

Climate Models as Economic Guides: Scientific Challenge or Quixotic Quest?

BY ANDREA SALTELLI, PHILIP B. STARK, WILLIAM BECKER, PAWEL STANO

A plea against audacious risk or cost-benefit analysis running over centennial time scales; example: crime rate as modified by climate change at US county level in 2100

Solutions? 2. Learn from what happens in statistics where the p-test crisis is being tackled head on

Cargo-cult statistics and scientific crisis

The mechanical, ritualistic application of statistics is contributing to a crisis in science. Education, software and peer review have encouraged poor practice – and it is time for statisticians to fight back. By **Philip B. Stark** and **Andrea Saltelli**

Solutions? 3. Use models *via negativa*

Nassim Taleb, Black
Swan, Antifragile,...

“models are most useful when they are used to challenge existing formulations, rather than to validate or verify them”

Naomi
Oreskes

N. Oreskes, K. Shrader-Frechette, and K. Belitz, “Verification, Validation, and Confirmation of Numerical Models in the Earth Sciences,” *Science*, 263, no. 5147, 1994.

IN SCIENCE AND TECHNOLOGY

4 VOL. XXX, NO. 2, WINTER 2014

When All Models Are Wrong

BY ANDREA SALTELLI, SILVIO FUNTOWICZ

The rules of sensitivity auditing

1. Check against rhetorical use of mathematical modelling;
2. Adopt an “assumption hunting” attitude; focus on unearthing possibly implicit assumptions;
3. Check if uncertainty been instrumentally inflated or deflated.

4. Find sensitive assumptions before these find you; do your SA before publishing;
5. Aim for transparency; Show all the data;
6. Do the right sums, not just the sums right;
7. Perform a proper global sensitivity analysis.
